

Implants

Dental implants are medical devices surgically implanted into the jaw to restore a person's ability to chew or improve physical appearance. They provide support for artificial teeth, such as crowns, bridges, or dentures.

Root Canal Therapy

Patients typically need a root canal when there is inflammation or infection in the roots of a tooth. During root canal therapy, the doctor carefully removes the pulp inside the tooth, cleans, disinfects and shapes the root canals, and places a filling to seal the space.
